

# UK and Irish offshore subsurface data

**The Source**  
for Critical Information and Insight™

## Seismic Lines and well data

IHS is the official data-release agent for the UK and Irish governments, producing basic and value-added products for the E&P industry. The IHS data specialists have proven capabilities for taking raw well data and processing it into meaningful, workstation-ready formats by formatting and standardising the data then applying the interpretation where needed. As one of the most comprehensive, accessible, and up-to-date sources of subsurface data, IHS offers you the benefits of ready to use accurate information which means you spend less time manipulating data and more time making decisions that add value to your company.

### The benefits of using IHS subsurface data

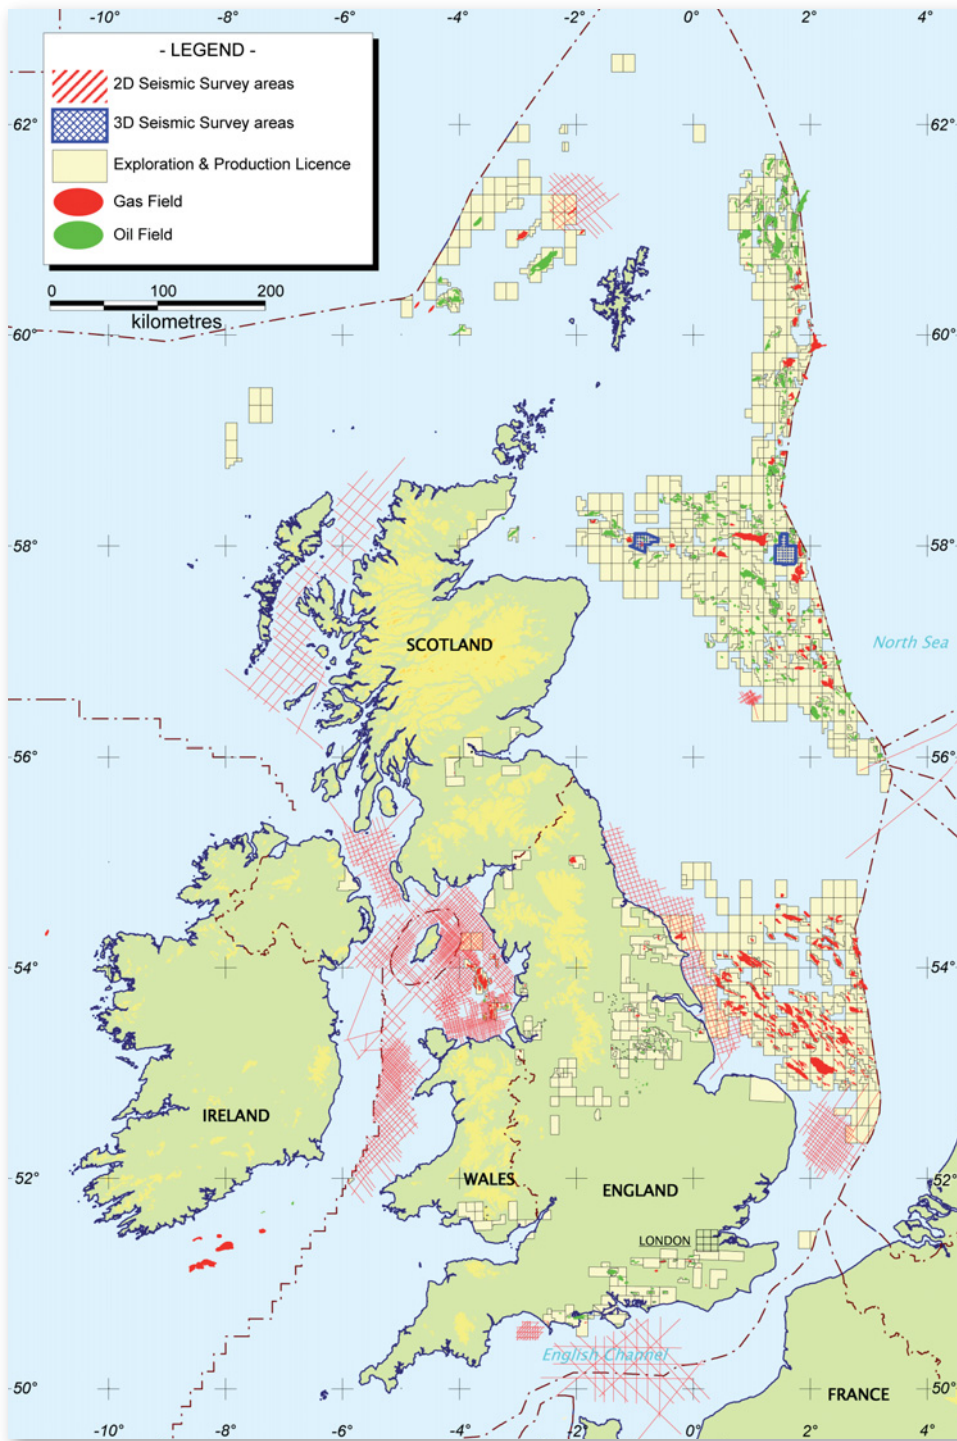

- **Save time** – Dramatically reduce the time and money you spend re-processing data
- **Save staffing costs** – Save the costs of employing experienced scientists on non-essential activities such as quality control work
- **Safety** – Anticipate and deal with potential drilling hazards, such as overpressure
- **Peace of mind** – Incorrect decisions, can have serious ramifications. Our data gives you peace of mind
- **Convenience** – All of our products are desktop and interpretation ready

### Crucial questions IHS subsurface data can help you address

- Where do I drill? Is it worth investing time and money in the region?
- Does this basin have the correct geological configuration of reservoir, source and seal?
- What is the reservoir continuity?
- Are the rock properties conducive for hydrocarbon production?
- What casing and mud programme will I have to use to make the well safe to drill?
- How many different drill bits did offset operators use to drill their websites?
- Can I drill more quickly and cost effectively?

To help you in your exploration IHS now has a certain amount of 2D and 3D seismic in key areas.

- Over 27,000 km of 2D seismic data (of which 15,000 km relates to the Irish Sea) and two 3D seismic surveys
- Data largely transcribed to modern media (including field tapes on 3590 or LT02 and stacks/migrations on CD)
- Deliverables including UKOOA navigation, velocities, field and processed data, accompanying reports
- High resolution aeromagnetic surveys also available
